

T-Bow[®] Physiotherapy

Healthy Spine

Back Stretching on the T-BOW[®]

By S Bonacina, G Cámara, I Chulvi and JL Parreño

Summary

1. A healthy back is a comprehensive pursuit that encompasses, among others: meticulous balance and coordination, well-balanced strength in the pelvic-back complex, finely tuned mobility of the spine within its inherent curvatures, heightened awareness of one's bodily parts, and a positive emotional state.

2. The T-BOW® is uniquely designed to replicate the natural curvature of the lumbar spine, offering corrective benefits for those with excessive or insufficient lordosis. It provides therapeutic advantages by helping correct spinal alignment through lying on it, making it suitable for a wide range of individuals.

Arch Adapted to Natural Lordosis of the Lumbar Spine

45-degree arch for the T-Bow® Wood.
40-degree arch for the T-Bow® Plastic.

Natural Lumbar Lordosis
40-50 degree arch
Diff. gender, age and condition

The only one on the market !!

a. Partially blocked vertebrae receive mobilizing pressure to promote the natural lordosis when lying backwards on the T-BOW®. Unlike softer tools such as Swiss balls or Bosu, the T-BOW® prevents the spine from sinking, ensuring proper alignment.

b. The T-BOW® allows for strengthening the abdominal muscles through a greater range of motion while maintaining a stable natural lumbar lordosis and proper movement pathway.

3. The T-BOW®'s high reactivity and anatomical support enhance kinesiological fixation of the back, preventing stable vertebrae from sinking and allowing for precise postural adjustments. Combining back extensions and rotations on the T-BOW® is vital for maintaining spine mobility.

3. Reactivity:

Exceptional reactivity provides users with swift tactile and kinesthetic feedback, enabling precise and quick adjustments to postures and movements, enhancing exercise effectiveness.

Functional twisting of the longitudinal axis of the leg !!
 Deep joint stabilisation with high reactivity !!

Back Stretching on the T-Bow®

The T-BOW® is designed with a curvature that mimics the natural lordosis of the lumbar spine, with a range between 30-60 degrees. This unique design (40 and 50 degrees for the plastic and wood versions, respectively) offers corrective benefits for individuals with excessive or insufficient lordosis. For those with excessive lordosis, lying backward on the T-BOW® corrects the spine to a normal position, while individuals with less than normal lordosis experience spine stretching to achieve the correct alignment.

Prolonged sitting often leads to reduced flexible lordosis, causing stress on intervertebral discs. Simply lying on the T-BOW® and engaging the abdominal muscles helps reposition the vertebrae and creates additional space for organs in the abdominal region.

The curvature's challenge for the spine strikes a balance between offering enough challenge for therapeutic benefits and ensuring safety and stability. This anatomically supportive design prevents excessive pressure on the vertebrae, making the T-BOW® suitable for a wide range of individuals, including those with pronounced spinal curvatures.

The T-BOW®'s high reactivity, paired with a comfortable mat on the convex part, enhances kinesiological fixation of the back. This responsiveness provides precise feedback, allowing for postural adjustments and balancing of the entire spine. Unlike softer surfaces, the T-BOW® prevents sinking of the back and facilitates quick postural feedback adjustments.

Diverse positions on the T-BOW® facilitate mobilization and stretching exercises, emphasizing upper and lower back extensions, flexions, rotations, lateral tilts, and combinations of these movements. The T-BOW® provides support for the executor's relief in a supine position, enabling physiological mobilization and stretching of the spine. This experience is further optimized using the T-Box®.

Its convex anatomical shape prevents stable vertebrae from sinking, offering slight mobilizing pressure and segmental mobilization. Combining back extensions and rotations on the T-BOW® is crucial for maintaining healthy levels of spine mobility and back stretching.

Additionally, the T-BOW® enables the optimization of highly reactive and precise static-dynamic balance situations in various postural arrangements, making it accessible to a broad range of individuals.

8. Postural Optimization:

With a primary focus on enhancing posture, the T-Bow® contributes to improved core strength, stability, and overall postural awareness, benefiting individuals seeking to reduce the risk of back pain.

Fitness centers integrating the T-Bow® stand to benefit from its versatility, effectiveness, and the diversity it introduces to their fitness offerings.

Tips for the Basic Backward Lying on the T-Bow® by S. Bonacina

Three crucial elements for proper backward lying technique are:

1. Ensure all vertebrae make contact with the bow.
2. Maintain a straight line between the neck and head.
3. Ensure the bottom touches the floor.

Inflexibility in the spine can hinder the ability to touch each vertebra to the bow. If the inflexibility is in the upper back, individuals may need to support their head constantly or, preferably, use an additional bow or similar support behind them.

To enhance flexibility in the upper back, a beneficial exercise involves starting by lying with the head on the floor, lifting the bottom high, and then gradually lowering it to the hips, only as far as the neck remains comfortable.

For those who struggle to touch the bow in the lower back, bending the knees while sitting on the floor and leaning towards the bow is necessary. While holding the head, gradually lower the upper body and press each vertebra against the bow one by one.
